AUTHOR: Ponyrko, S. A.TITLE: Using analog computers to solve integral equations

16.44.55

SOURCE: IVUZ, Priborostroyeniye, v. 8, no. 4, 1965, 71-76

TOPIC TAGS: computer application, Volterra equation, integrodifferential equation, integral equation

ABSTRACT: The author proposes a method for direct use of the dynamic properties of an analog computer in solving integral equations. Volterra's integral equation of the first kind

$$f(t) = \int_0^t K(t, \tau) u(\tau) d\tau. \quad (1)$$

is considered. It is assumed that the kernel of the equation may be realized (exactly or approximately) as the weighting function of some system. The method of solution is based on the circumstance that the input variable  $u$  and the output variable  $f$  of such a system are related by equation (1), which may be considered with respect to function  $u(t)$  as an integral equation in which the given elements are the

Card 1/2

L 293)-66

ACCESSION NR: APB091119

function  $f(t)$  and the kernel  $K(t, \tau)$ . The inverse problem, finding the input signal  $u(t)$  from a given output signal  $v(t)$  may be solved by finding the equation  $L_1(f) = L_2(u)$  of the system  $W$  which has  $K(t, \tau)$  as its weighting function, and by simulating this equation with  $u$  as the output variable. Such a system is called an inverse system when the solution of equation (1) reduces to constructing a model of the inverse system  $W^{-1}$ , and to inserting the given function  $f(t)$  at its input. The output signal is the solution  $u(t)$ . The initial conditions  $u^{(k)}(0)$  may be found by successive differentiation of (1) with respect to  $t$  and setting  $t = 0$ . The model which corresponds to the transformation of (1) may be used as an element of a system for solving equations of more complex types. Various examples are given for linear and non-linear integral equations with block diagrams of the mathematical models. Orig. art. has: 4 figures, 2 equations.

Stabilization of aircraft and autopilots (Stabilizatsiya letatel'nykh apparatov i autopilaty), Moscow, Izd-vo "Vysshaya shkola", 1964, 483 p. illus., bibli. 5,500 copies printed.

TOPIC TAGS: automatic control system, autopilot, aircraft

PURPOSE AND COVERAGE: This book presents materials of the open Soviet and foreign press on the basic problems of the theory, construction principles, features of components, and the use of automatic control systems for controlling the flight of flying craft. In addition, it describes the characteristics and includes data on some autopilots. The book is a textbook for students in correspondence and evening departments of aviation higher technical educational institutes and can also be used by engineers and technicians working in the automation of flying craft.

TITLE:

On a method of solving certain statistical problems  
of the applied theory of gyroscopes

PERIODICAL:

Referativnyy zhurnal. Mekhanika, no. 10, 1961, 11,  
abstract 10 A77 (V sb. 1-ya Mezhvuz nauchno-tekhn.  
konferentsiya po probl. sovrem giroskopii, L., 1960,  
114-125)

TEXT: A method is given for solving problems on the pre-  
cision of research in which the gyroscope element maintains a given  
direction in space under conditions of continuously acting pertur-  
bances, these perturbances being regarded as random functions  $x(t)$   
of the time, and the distribution being characterized by the mean  
square error  $\sigma_y$  of the quantity  $y$  which gives the deflection of  
the system. The method is based on the solution of the equation  
connecting the correlation function of the disturbance  $R_x(\tau)$  and

Card 1/2

D251/D301.

On a method...

the deflection of the system  $R_y(t)$  with  $\sigma_y^2 = R_y(0)$ . According to the author, the method is suitable for solving problems on the influence of stationary random perturbances in the absence of a "useful signal" on linear systems and non-linear systems with small nonlinearities of the relay type and can serve as an apparatus only in the framework of the correlation theory. AUTHOR: Pony\*rko, S. A.

TITLE: Determining the static accuracy of closed systems with random characteristics

SOURCE: IVUZ. Priborostroyeniye, v. 7, no. 1, 1964, 57-62.

TOPIC TAGS: automatic control system, closed loop automatic control system, closed loop system static characteristic, closed loop system theory

ABSTRACT: Probabilistically describable closed-loop automatic-control systems are considered. Generalized static characteristics of the plant are given by  $W_o(y/x, z)$ , where  $y$  is a plant-motion parameter,  $x$  is the control response, and  $z$  is the disturbance. Similarly, the controller is characterized by this law of probability distribution:  $W_p(v/u) = f_2(v, u)$ , where  $u$  and  $v$  are input and output coordinates of the controller, respectively. The distribution for an open-loop system is given by:  $W^*(y/u, z) = \int W_o(y/x, z) W_p(x/u) dx$ . For a closed-loop system, the static characteristics will be:

Card 1/2

ACCESSION NR: AP4018996

$$p_1(y) = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} W_o(y/x, z) W_p(x/\xi) p_1(\xi) d\xi dx.$$

$$p_2(x) = \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} W_p(x/y) W_o(y/\xi, z) p_2(\xi) d\xi dy.$$

The above probabilistic characteristics of the system are used to determine the mean static error of the control system:

$$\delta = \int_{-\infty}^{\infty} y |W(y/z_s) - W(y/z_0)| dy.$$

The latter formula refers to the case of a determinate  $Z$ :  $W(z) = \delta(z - z_0)$ .

Orig. art. has: 1 figure and 21 formulas.

AUTHORS: Gorentsvit, G.E., Ponyrko, S.A.TITLE: The oscilloscopic method of determining the correlation function  
of a random stationary processPUBLICATION: Matematicheskiy zhurnal. Fizika, no. 4, 1961, 374, abstract 4210297  
("Izdatelstvo Akademii Nauk SSSR", 1961, v. 32, #17, 31P)TEXT: The authors propose an experimental method of determining correlation functions of random stationary processes, using a simple apparatus. The method is based on concepts in studies of random quantities distribution, extended to random processes with continuous time. The random process being studied is represented by a variable electric voltage whose values (separated by time intervals  $\Delta t$ ) are supplied respectively to the vertical and horizontal plates of an electronic oscilloscope. The calculational method, presented in the article, enables one to determine the value of correlation function from the shape of the curves on the oscilloscope screen. According to estimates cited, the error in using the described method amounts to  $\sim 15\%$ .

TITLE: Oscilloscopical method for the determination of the correlation function of a stationary random process

PERIODICAL: Referativnyy zhurnal, Matematika, no. 5, 1961, 21, abstract 5V145. (Izv. Leningr. elektrotekhn. in-ta, 1959, 39, 307 - 312)

TEXT: A simple method is proposed for the experimental determination of the correlation function of the stationary Gauß process  $x(t)$ . An electric potential, proportional to  $x(t)$ , is added to the vertical deflecting plates, and another one, proportional to  $x(t - \tau)$ , is added to the horizontal plates. As a result of the averaging effect of the eye, a figure with a clear contour is obtained on the screen - this is the ellipse of the same probability. By measuring the proportion of the axes of the ellipse for various  $\tau$ , and using the relation

$$\varphi(\tau) = (1 - (a/b)^2)/(1 + (a/b)^2),$$

where  $a$  and  $b$  are the two axes, one obtains values of the correlation

TITLE: Species irradiation effect in wild rodents

SOURCE: AN EstSSR. Institut eksperimental'noy biologii. Vliyaniye gamma-oblucheniya na organizmy (Effect of gamma rays on the organism). Tallinn, 1965, 77-88, and insert following p. 88

TOPIC TAGS: radiation sensitivity, irradiation effect, experiment animal, medical experiment, RODENT

ABSTRACT: The irradiation effect in wild species of rodents was investigated. Mice, rats, hamsters, rabbits, and guinea pigs, used in laboratory tests, showed various degrees of radiation sensitivity. Steppe lemmings (*Lagurus lagurus* Pall.) were used for experiments. Their radiation sensitivity was compared with that of albino mice, which have been intensively examined by many investigators. It was found that steppe lemmings are more sensitive to the effects of radiation than are mice. Changes in the organism caused by the irradiation effect are similar in mice irradiated with a dose of 600 r and in lemmings irradiated with a dose of 800 r. It was found that the spleen and the thymus are the most sensitive organs. The effect of a 1000-r dose in lemmings is almost 100% lethal. The most resistant age of lemmings and mice was

TITLE: Effect of blood transfusion from irradiated hens on the radiation sensitivity of chicks

SOURCE: AN Est'sRR. Institut eksperimental'noy biologii. Vliyaniye gamma-oblucheniya na organizmy (Effect of gamma rays on the organism). Tallinn, 1965, 89-93

TOPIC TAGS: medical experiment, blood, radiation sensitivity, irradiation effect, gamma irradiation, blood transfusion, EXPERIMENT ANIMAL

ABSTRACT: The effect of blood transfusion from irradiated hens on the radiation sensitivity of chicks has been investigated. Young New Hampshire chicks were exposed to Gamma irradiation (800—1000 r). The following year the blood of those irradiated hens was injected into 20-day old Australorp chicks. A second group of chicks got blood from nonirradiated adult hens; nontreated chicks made up the control group. The day after the blood transfusions, all three groups of chicks were exposed to  $\gamma$ -irradiation. The lethal effect of irradiation was highest in the chicks injected with blood from non-irradiated hens (93%) and almost as high in non-treated chicks (86%). The chicks injected with blood from irradiated hens were the most

TITLE: Effect of prolonged administration of ACTH on the activity of some enzymes in the adrenal glands of rats

SOURCE: Biologia, no. 4, 1965, 268-273 10

TOPIC TAGS: ACTH, enzyme, rat, gland, endocrinology

ABSTRACT: Influence of extended administration of ACTH upon the activity of phosphotyrase, glucose-6-phosphate dehydrogenase, hexokinase and amylase, and upon the glycogen content of adrenal glands was investigated. After 10 days of ACTH treatment the total activity of phosphotyrase and glucose-6-phosphate dehydrogenase increased and the glycogen content decreased. This agrees with the theory of the ACTH action, according to which ACTH stimulates the formation of NADPH. Orig. art. has: 2 figures and 1 table. [JPRS]

"Influence of TSH on the Activity of Peroxydase and Reducing  
Dehydrogenase in the Thyroid Gland."

Prague, Ceskoslovenska Fysiologie, Vol 15, No 2, Feb 66, pp 104-105

Abstract: Thyrotrophic hormone (TSH) was administered to rats, and its influence on the formation of the thyroid hormones investigated. Exogenous TSH and endogenous TSH, whose secretion was stimulated by unilateral thyroidectomy were compared in their effect on the activity of peroxidase and reducing dehydrogenase in the thyroid gland. 1 Figure, 4 Western, 1 Czech reference. "The Effect of Guanethidine on the Noradrenaline Level of the Brain and  
Its Pharmacological Significance"

Budapest, Acta Physiologica Academiae Scientiarum Hungaricae, Supplement  
to Vol 22, 1963; p 31.

Abstract [Authors' English summary, modified]: The antihypertensive drug  
guanethidine significantly reduces the noradrenaline level of the rat's  
brain. At the lowest noradrenaline level the behavior of the animals  
resembles the effect of reserpine in that sedation, myosis, defecation  
are observable. Guanethidine has no influence on the spontaneous motility  
of mice, but significantly reduces the locomotor excitation caused by  
amphetamine, whereas reserpine decreases spontaneous motility but has  
no effect on excitation caused by amphetamine. It seems that the de-  
crease of the noradrenaline level is due to depletion, though an inter-  
ference in noradrenaline synthesis cannot be ruled out.

Title : Polarography of Magnesium CIA-RDP86-00513R001342210006-2"

Orig Pub : Acta chim. Acad. sci. hung., 1956, 9, No 1-4, 27-36.

Abstract : It was found at the study of oscillographic curves ( $v, t$ ) obtained on a Hg drop electrode for the solution of  $Mg^{2+}$  in 0.7 M  $(CH_3)_4NCl$  that  $Mg^{2+}$  produced a reversible stage at -2.55 v. But the polarographs of the same substance taken on an improved (RZhKhim, 1956, 61824) flowing electrode (FE) have the shape of ordinary waves without maxima (M). The height of these wave is proportional to the  $Mg^{2+}$  concentration at c from  $5 \cdot 10^{-4}$  to  $3 \cdot 10^{-3}$  M; if c was greater than  $3 \cdot 10^{-3}$  M, a M appears on the waves, the

Card 1/2

magnitude of the M decreases with the decrease of the FE length. The FE wave is observed at pH of 5 to 9.5:  $E_{\frac{1}{2}}$  does not depend on pH (-2.59 v according to the standard c. e.). In the authors' opinion, the M on the  $Mg^{2+}$  waves is caused by the increase of  $Mg^{2+}$  concentration at the electrode surface due to the hydrolysis of Mg amalgam forming at the electrolysis.

13. A new type polarographic cell with flowing mercury electrode/*K. G. Kurihara, I. Podd. Magyar Kémiai Folyóirat. Vol. 62, 1956, No. 2, pp. 64-68, 3 figs.*

A new device with a flowing mercury electrode, suitable for polarographic and oscillographic measurements, is described. The cell is an elliptically shaped enclosed vessel made from glass tube. For the introduction of the mercury stream a capillary tube, arranged tangentially to the wall of the cell and inclined at about 45° upwards, is inserted through a ground glass stopper. A ground glass stopper and a glass tube (overflow) are sealed to the bottom of the cell at a determined distance from the capillary to ensure a constant level of mercury within the vessel. In order to eliminate the

slight volume variations occurring in the cell as a consequence of the expansion of the liquid a small vertical glass tube is fused into the cell its lower end reaching below the electrolyte surface and its upper end opening outward. The capacity of the cell is about 25 ml. A calomel reference electrode may be inserted into the ground glass stopper at the bottom of the cell for the determination of the half-wave potentials. Advantages of the cell are: during the flow of the mercury the surface of the mercury jet in contact with the liquid and the distance of the electrodes remains constant, it is not subject to variations as in cells of conventional design. The surface of the flowing mercury electrode is precisely reproducible even after refilling, thus the data on different runs are directly comparable.

Title: Polarography of Magnesium

Original  
Periodical: A magnezium polarografija, Magyar kem. folyoirat, 1956, 62, No 3,  
102-106; Hungarian; German resumé

Abstract: Mg is reduced at a flowing Hg-cathode and gives a clearly defined  
wave with  $E_{1/2} = -2.6$  v. A polarographic method has been worked  
out for determining  $5 \cdot 10^{-4}$  -  $3 \cdot 10^{-3}$  M solutions of Mg in the  
presence of K with a background of 0.7 M  $N(CH_3)_4Cl$  at pH 5.4-6.8.  
 $Li^+$  and  $Ca^{2+}$  interfere.

TITLE: Analysis of liquid-solid chromatography of benzene, toluene, methyl-ethylcetone mixtures and of benzene, toluene and acetone mixtures

PERIODICAL: Petrol și Gaze, v. 11, no. 12, 1960, 561 - 565

TEXT: One of the modern procedures of lubricant refining is the paraffin stripping by selective solvents. Propane mixtures of aromatic hydrocarbons (benzene and toluene) and ketone (acetone and methylethylketone) are used as solvents. The usual methods of determining the content of each component are not very accurate and fairly slow. For this, the authors have worked out a method for separating the components from the solvent, based on the property of different adsorbents to selectively adsorb the aromatic hydrocarbons and ketones. The solvent formed of aromatic hydrocarbons and one ketone is completely adsorbed in a chromatographic column by the activated silica gel, used as adsorbent. By desorption with methyl or ethyl alcohol the aromatic hydrocarbons appear first and then the respective ketone. The overall concentration of the aromatic hydrocarbons and of the respective ketone can be determined in function of the refraction

Analysis of liquid-solid chromatography of...

index of every fraction. The concentration of benzene and toluene is determined on the basis of the benzene-toluene mixture ratio and the refraction index of the aromatic level. The following apparatus is used: chromatographic column of glass; collecting vessel for measuring each fraction collected from the column with a precision of  $\pm 0.005$  ml (Fig. 3); approximately 15 test tubes (100 x 12 mm) for collecting the fractions; Abbe refractometer for the determination of the refraction index of the fractions with an accuracy of  $\pm 0.0002$  units. The following chemical substances have been used: silica gel made by the Uzinele so- dice (Sodium Plant) in Ocna Muresului, benzene of a 99.8% purity  $n_D^{20} = 1.5011$ ; toluene of a 99.8% purity  $n_D^{20} = 1.4969$ ; acetone  $n_D^{20} = 1.3591$ ; methylethylketone  $n_D^{20} = 1.3791$ ; methyl alcohol p.a.; ethyl alcohol p.a.; air or compressed ni- trogen at approximately 2 atm; lubricant for valves, insoluble in hydrocarbons, and ketone. Silica gel of a granulation of 0.10 - 0.20 mm is first activated by heating at 150 - 160°C and is then filled into the chromatographic column until it reaches a height, 30 - 40 mm below the glass-ball of the column. 25 ml of the sample is then introduced into the glass-ball. An additional pressure by nitro- gen, attaining 0.3 - 0.6 atm is applied (Fig. 4) to obtain an average flow speed of 10 - 30 mm/min. Then, 50 ml of methyl or ethyl alcohol are added. Ethyl al- cohol is used in case of benzene, toluene and methylethylketone mixtures and

Card 2/10

Analysis of liquid-solid chromatography of...

methyl alcohol in case of benzene, toluene and acetone mixtures. Again pressure is applied and fractions of 0.5 - 3.5 ml are collected, after which the refraction index of each fraction is determined. Table 1 compiles the data obtained by the determination of a benzene, toluene and methylethylketone mixture. The first groups consist of benzene, toluene; the second of benzene, toluene and methyl-ethylethylketone (or acetone); the third of methylethylketone; and the fourth of methylethylketone and ethyl alcohol or acetone and methyl alcohol. On the basis of the refraction indexes of the fractions, one is able to compute the total volume of benzene and toluene, respectively the volume of methylethylketone. The refraction indexes are designated as follows:  $n_{Ar}$  = aromatic hydrocarbons;  $n_{MEC}$  = methylethylketone;  $n_f$  = individual fraction;  $n_a$  = alcohol. The volumes are designated by:  $V_{Ar}$  = aromatic hydrocarbons;  $V_{MEC}$  = methylethylketone; and  $V_f$  = individual fraction. The hydrocarbon volume of the first group is computed by  $V_{ArI} = V_f$ , and that of the second group by:  $V_{ArII} = \sum \frac{n_f - n_{MEC}}{n_{Ar} - n_{MEC}} \cdot V_f$ . The volume of methylethylketone of the second group is calculated by:  $V_{MECII} = V_{II} - V_{ArII}$ , and that of the fourth group by:  $V_{MECIV} = \sum \frac{n_f - n_a}{n_{MEC} - n_a} \cdot V_f$ . The third group consists only of methylethylketone. The total volumes are computed by:

Card 3/10

R/007/60/011/012/001/001

A231/A126

**Analysis of liquid-solid chromatography of...**

$V_{Ar} = V_{Ar_I} + V_{Ar_{II}}$  and  $V_{MEC} = V_{MEC_{II}} + V_{MEC_{III}} + V_{MEC_{IV}}$ . The total volume is:

$V = V_{Ar} + V_{MEC}$ . The benzene and toluene concentration is calculated by the relation which exists between the refraction index and the benzene-toluene ratio of the pure aromatic fraction. Table 2 contains the results of the calculation. The benzene concentration was determined on the basis of Table 3. For the establishment of the analysis method, synthetic mixtures have been used. The results of the determination of benzene-toluene-methylethylketone mixtures and benzene-toluene-acetone mixtures are given in Table 4 and 5, respectively. The method is accurate, the apparatus are very simple and the duration of analysis is short (1 - 1.5 h). There are 5 tables, 5 figures and 5 references: 2 Soviet-blue and 3 international.

TITLE: Determination of parts per million amounts of C sub 2-C sub 5 carbons in air, hydrogen and methane gas

SOURCE: Revista de chimie, v. 16, no. 2, 1965, 101-103

TOPIC TAGS: hydrocarbon, methane, hydrogen, chromatography

ABSTRACT: The authors describe a method for the determination of very small amounts of C<sub>2</sub>-C<sub>5</sub> hydrocarbons in air, hydrogen or methane gas. The method makes use of the concentration of the impurities by means of a special device, followed by gas-liquid distribution chromatography. The maximum relative error for determinations within 1 and 20 parts per million is 12 percent, and for determinations in the range 0.1 to 1 parts per million it is 25 percent. Bucharest, Revista de Zootehnica si Medicina Veterinara, Vol. 16, No. 12, Dec 66, pp 59-69.

Abstract [Author's English summary modified]: A summary regarding the foundation and advantages of germ-free and pathogen-free animal research is included. It is noted that the specific pathogen-free animals, i.e. those born after the placental barrier, infected only one born by Caesarean delivery and are immediately removed from their mothers, being raised under appropriate germ-free conditions, can become the breeding stock for further generations of animals with specific pathogen-free flora; the biologic characteristics of such animals as well as their utilization in research are discussed.

Title : The Problem of Studying the Honey Production of  
the Medicinal Grecian Foxglove Plant (*Digitalis*  
*lanata*).

Orig Pub: Apicultura, 1958, 31, No 3, 101-102.

Abstract: In the second year, the Grecian foxglove (*Digitalis*) forms a spear which is 60-80 cm long and has 70-110 blossoms; it blooms 20-25 days in June to August. It is visited by the bees from morning until 8 o'clock at night even on cloudy days. The quantities of sugar obtained in 100 g of blossoms gathered at 10 o'clock in the morning amount to:  
a) 0.23 g after very clear nights; b) 0.26 g after nights with ample precipitation; c) 0.48 g from

"An Episode of Mass Carriers with Salmonella."

Bucharest, Microbiologia, Parazitologia, Epidemiologia, Vol 11, No 6, Nov-Dec 66, pp 559-562.

Abstract: In the course of a series of 7,312 bacteriologic tests during the season of high enterobacterial infectivity (June -August) in Oradea, 287 asymptomatic carriers of Salmonella anatum were discovered, as well as 78 carriers of S. typhimurium and 15 of S. enteritidis Gaertner. Epidemiological and laboratory studies implicated especially milk and dairy products in the spread of S. anatum infection.  
Includes 3 tables and 4 Rumanian references.
